

1 Introduction

I am interested in economics and data science for many reasons. I enjoy the challenge of the material and rewards for accomplishing tasks. My interests in economics are in the area of income inequality. This subject has become a major focus for many great economists such as Thomas Piketty. For the data science side, I am interested in learning tools that will directly relevant to future job prospects. Most businesses today value these skills much more than any others. I am looking into doing my research paper in this class on something from labor economics. I will graduate in May and the Department of Labor is one of the positions I am targeting. My hope is to learn more about what they do through my project. My goal for this class is to equip myself with useful tools for the job market.

2 Equation

$$a^2 + b^2 = c^2$$
